Primary School

Fire Safety

The Challenge

We were appointed to deliver a comprehensive package of passive fire protection works at a school in NE London as part of a critical fire safety compliance programme. The scope included the development of a fire strategy, installation of approximately 300m of fire compartmentation, and replacement of non-compliant fire door sets. All works were undertaken within a live, occupied school environment, with heightened health, safety, and safeguarding considerations. Programme constraints were fixed around school holidays and half-term periods, meaning all activities had to be delivered within immovable deadlines while maintaining school operations and ensuring pupil safety.

The Solution

We delivered a carefully phased and fully compliant solution, aligned to the school's operational requirements and academic calendar. This included a detailed fire safety survey and fire strategy, installation of fire compartmentation to wall heads, and fire stopping of service penetrations using certified **fire batt systems** and **intumescent collars**.

Existing doors were logistically removed and replaced with fully compliant **FD30-rated fire door sets**, improving both life safety and regulatory compliance. Through flexible resourcing, robust programme management, and enhanced safeguarding controls, all works were completed safely, on time, and within budget.

“

The team delivered a complex fire safety programme in our live school environment with outstanding organisation and care. Their planning around holidays ensured zero disruption to pupils and staff.

The works were completed safely, on time, and to a very high standard, giving us full confidence in our building's fire safety compliance.”
